You can generate your custom css gradient in HEX or RGBA color format. As a [free css gradient generator tool](#), this website lets you create a colorful gradient background for your website, blog, or social media profile.

## What is a Gradient?

In computer graphics, a color gradient specifies a range of position-dependent colors, usually used to fill a region.[1] For example, many window managers allow the screen background to be specified as a gradient. The colors produced by a gradient vary continuously with position, producing smooth color transitions. A color gradient is also known as a color ramp or a color progression. In assigning colors to a set of values, a gradient is a continuous colormap, a type of color scheme.

In nutshell, a gradient is the smooth transition of one or more shades in our canvas. Mostly, gradients are used to come up with visually appealing and soothing backgrounds. Compared to flat colors, a gradient color canvas is smoother and will highlight your content. It will also

add more depth to your designs, making them memorable. Though, while working on gradients, make sure you there is a smooth transition of colors and try not to overdo it.
